OPTIMAL YIELDS DUE TO GENETICS

One can increase
one's yields
by simply choosing
the right hybrid!

The steady genetic progress made over the past fifty years has meant an average farm gain of 1,2 q/hectare/year. Choosing the variety that is best suited to one's farm - among the 2000 seed varieties of corn produced in France - is to ensure higher yield consistency, which is the result of better resistance to weather hazards, pests, and diseases.

Harvest Situation and Production Outlook: Current Numbers Exceed Initial Estimates

Favourable weather has brought satisfactory seed corn productions in Europe, even above the levels estimated for 2023.

World Corn Market Situation Puts Pressure on Prices

The world corn stock increase has put heavy pressure on prices over the past couple of months. The pressure should continue at least until early 2024, at which point the onset of El Niño may change the trend.

Promoting Corn Seeds in Romania

The FNPSMS attended the 2023 FarmConect event under the Seeds for Future promotion campaign and its mission was to emphasize the quality of European corn seeds - particularly of those produced in France (the world's first corn seed exporter). Seed production and hybrid innovation are key elements for Europe's leading position in agriculture and they allow producers to grow high-quality grains that are adapted to the continent's climates.

Study Tour Focused on France's Seed Corn Industry

The FNPSMS organised a study tour allowing several participants from France, Romania, Bulgaria, Italy, and Spain to have a complete overview of the actors involved in seed multiplication in France, as well as a snapshot of the industry's structure and of the methods used to ensure the high-quality standards of a sustainable sector.
